

Meowvate PreMortem AI

Hackathon Build Plan | AI Chaos Simulator for Enterprise Operations

Tagline: Find the failure before it finds you.

1. Product Direction

Build a simple, memorable enterprise AI product: users upload or paste a policy, SOP, report, or workflow document, choose a crisis scenario, and the AI simulates what could go wrong. The app then generates a failure map, risk score, prioritized fix plan, and audit trail.

Item	Decision
Primary category	Track 4 - Data & Intelligence
Secondary category	Track 2 - AI Agents with Google AI Studio
Optional angle	Track 1 - Governance / Auditability through risk logs and human approval
Core promise	Turn enterprise documents into predictive operational risk intelligence
Board-friendly pitch	Like a fire drill for enterprise workflows - before the real failure happens

2. MVP Screens

Screen	What to build	Outcome
1. Scenario Simulator	Upload/paste document, select crisis scenario, click Run PreMortem	Judge understands the product in 30 seconds
2. Failure Map	Risk score, weak points, severity cards, impacted areas	The visual wow moment
3. Fix Plan + Audit Trail	AI actions, owner suggestions, evidence needed, approve/edit/reject flow	Enterprise trust and practical business value

3. Build Phases

Phase	Task	Outcome
Phase 1	Finalize product copy, demo story, scenarios, sample docs	Clear direction before coding
Phase 2	Create React/Vite app, routing, theme, layout shell	Polished base app
Phase 3	Build Scenario Simulator screen	User can upload/paste and choose a crisis
Phase 4	Add Gemini analysis endpoint / prompt pipeline	AI returns structured risk JSON
Phase 5	Build Failure Map UI	Risk score, severity cards, weak points
Phase 6	Build Fix Plan generator UI	Actions, owners, evidence, priority
Phase 7	Add audit trail and human approval states	Enterprise governance layer
Phase 8	Add demo fallback data and sample documents	Demo works even if API fails
Phase 9	Polish UI, loading states, empty states, export button	Hackathon-ready presentation
Phase 10	Prepare README, pitch, slides, demo video script	Submission-ready package

4. Cursor-Assisted Time Estimate

Build level	Estimated time	Outcome
Clickable prototype	2-4 hours	3 polished screens with mock analysis
Working Gemini MVP	5-8 hours	Paste/upload -> AI analysis -> failure map -> fix plan
Hackathon-ready	10-15 hours	Stable demo, fallback mode, sample docs, polished UI
Strong winning attempt	16-24 hours	Premium UX, export report, pitch assets, demo video

5. Suggested Tech Stack

Layer	Tool	Keep it simple
Frontend	React + Vite + Tailwind	Fast UI build and premium demo feel
Backend	Node/Express or FastAPI	One analyze endpoint is enough
AI	Gemini Flash + Gemini Pro	Flash for extraction, Pro for deeper scenario reasoning
Database	Supabase	Store analyses, audit trail, sample projects
Storage	Supabase Storage or local upload	Use simple text/PDF input for MVP
Optional	Export PDF report	Nice submission/presentation bonus

6. AI Output JSON Contract

Ask Gemini to return structured JSON only. Build UI from this shape:

```
{
  "executive_summary": "...",
  "risk_score": 82,
  "scenario": "Regulatory audit tomorrow",
  "critical_failures": [{"title": "...", "why": "...", "impact": "..."}],
  "weak_points": [{"area": "Approval workflow", "severity": "Critical", "evidence": "..."}],
  "fix_plan": [{"action": "...", "owner": "...", "priority": "High", "evidence_needed": "..."}],
  "audit_log": [{"event": "Document analyzed", "actor": "AI", "timestamp": "..."}]
}
```

7. Demo Scenarios

Scenario	Demo value
Regulatory audit tomorrow	Shows compliance and evidence gaps clearly
Critical vendor fails delivery	Shows operational dependency risk
Customer escalation in 24 hours	Shows response workflow and accountability
Sensitive data mishandled	Shows governance, access, and audit-risk angle

8. Must-Have vs Avoid

Must-have	Avoid
Reliable sample data and fallback mode	Complex login / user roles
Clear 3-screen flow	Huge multi-agent architecture
Risk score + failure map	Overly technical architecture screens
Fix plan + audit trail	Permit-only positioning
Strong pitch and demo script	Building features judges will not see

9. Final Demo Flow

Step	What happens	Why it matters
1	Upload or select a sample SOP/report	Instantly understandable
2	Choose crisis scenario	Creative simulation angle
3	Run PreMortem	Clear action trigger
4	Show risk score and failure map	Wow moment
5	Open generated fix plan	Business value
6	Approve/edit one action	Human-in-the-loop trust
7	Show audit trail / export brief	Enterprise-ready ending

10. Submission Checklist

Asset	Status target
Project title	Meowvate PreMortem AI
Short description	AI chaos simulator that finds enterprise workflow failures before they happen
Long description	Explain document upload, scenario simulation, risk map, fix plan, audit trail
GitHub README	Problem, solution, architecture, setup, demo screenshots
Demo video	2-3 minutes, focus on story and wow moment
Slides	Problem -> solution -> demo -> business value -> tech -> future
Cover image	Futuristic cat operator + enterprise risk dashboard

11. Winning Focus

Do not try to build everything. Build one reliable, polished story: enterprise teams can simulate failure, see weak points, and get a practical fix plan before real damage happens.
